

If you know how to find the area of 2D shapes, then this will be easy!

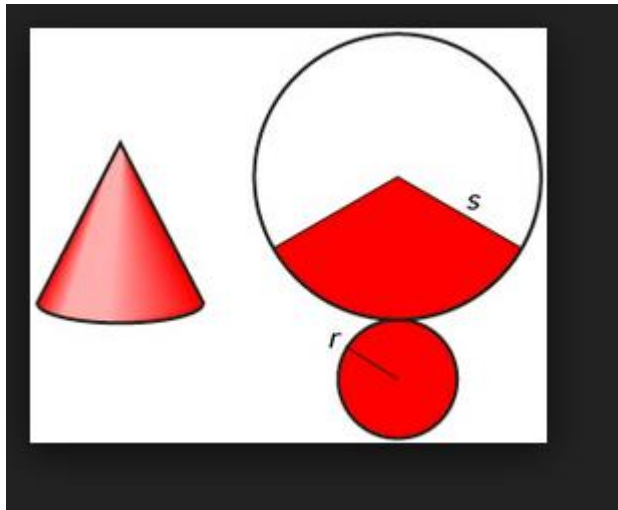

Polygons and Circle	Area Formula
Triangle	$A = \frac{1}{2} \cdot b \cdot h$
Rectangle	$A = l \cdot w$
Square	$A = s^2$
Parallelogram	$A = b \cdot h$
Trapezoid	$A = \frac{1}{2} \cdot h(b_1 + b_2)$
Regular Polygon	$A = \frac{1}{2} \cdot a \cdot P$
Circle	$A = \pi \cdot r^2$

# What is Surface Area?

The sum of all the **areas** of all the shapes that cover the **surface** of the object.

Think: 3D shapes but adding all the flat 2D shapes.

Examples:

How much paint to use to cover a room...

How much material to use for a package or a box...

How much construction material for a 3D structure...

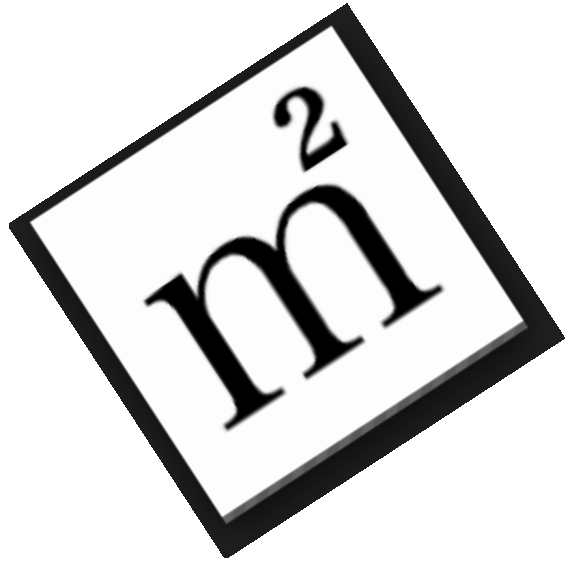

# Class One

# Surface Area

Cube

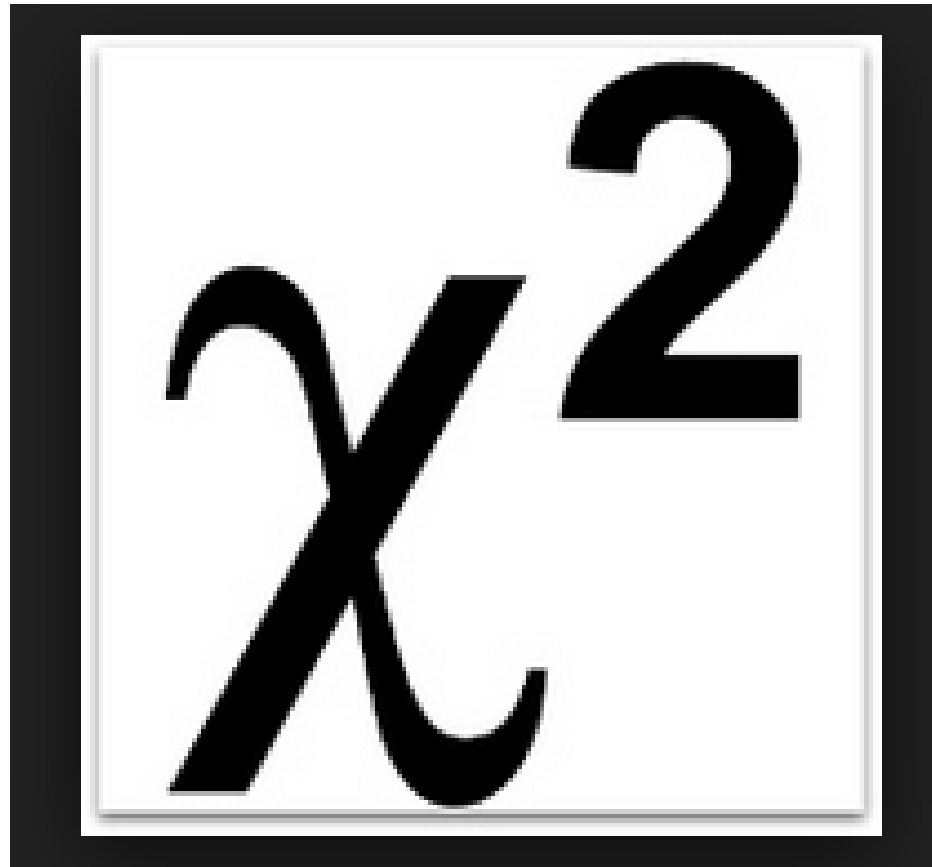

The unit in your answer must be squared because we want to know how many flat squares it takes to cover the shape.

$m^2$

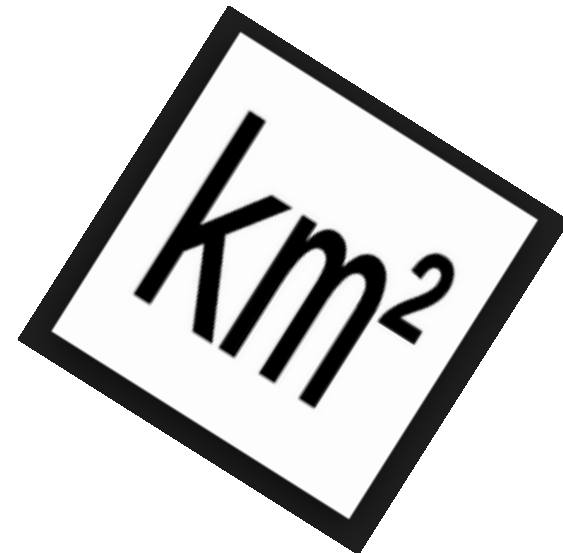

$cm^2$

$x^2$

$in^2$

$km^2$

## Flat Cube: Net

Looking at the cube template, it is easy to see that the cube has six sides and each side is a square

The area of one square is  $a \times a = a^2$

Since there are six sides, the total surface area, call it SA is:

$$SA = a^2 + a^2 + a^2 + a^2 + a^2 + a^2$$

$$SA = 6 \times a^2$$

Find the surface area if the length of one side is  $\frac{1}{2}$  cm

$$\text{Surface area} = 6 \times a^2$$

$$\text{Surface area} = 6 \times \left(\frac{1}{2}\right)^2$$

$$\text{Surface area} = 6 \times \frac{1}{2} \times \frac{1}{2}$$

$$\text{Surface area} = 6 \times \frac{1}{4}$$

$$\text{Surface area} = \frac{6}{4} \text{ cm}^2$$

$$\text{Surface area} = \frac{3}{2} \text{ cm}^2$$

$$\text{Surface area} = 1.5 \text{ cm}^2$$

$\frac{1}{2}$  cm

You practice with your teacher...

---

Surface Area of a cube =  $6a^2$

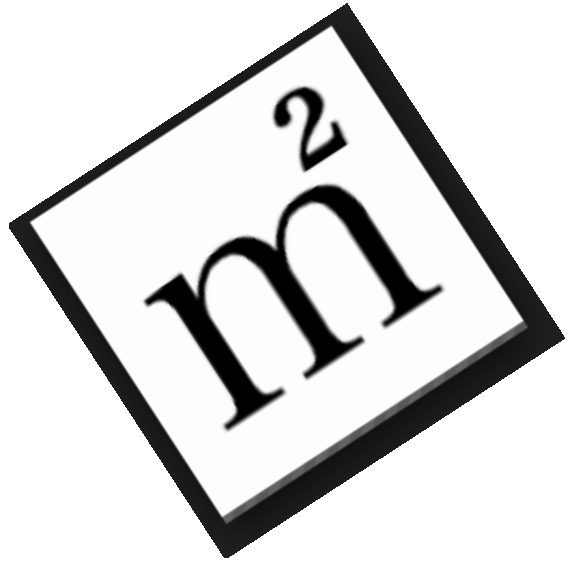

# Class Two

# Surface Area

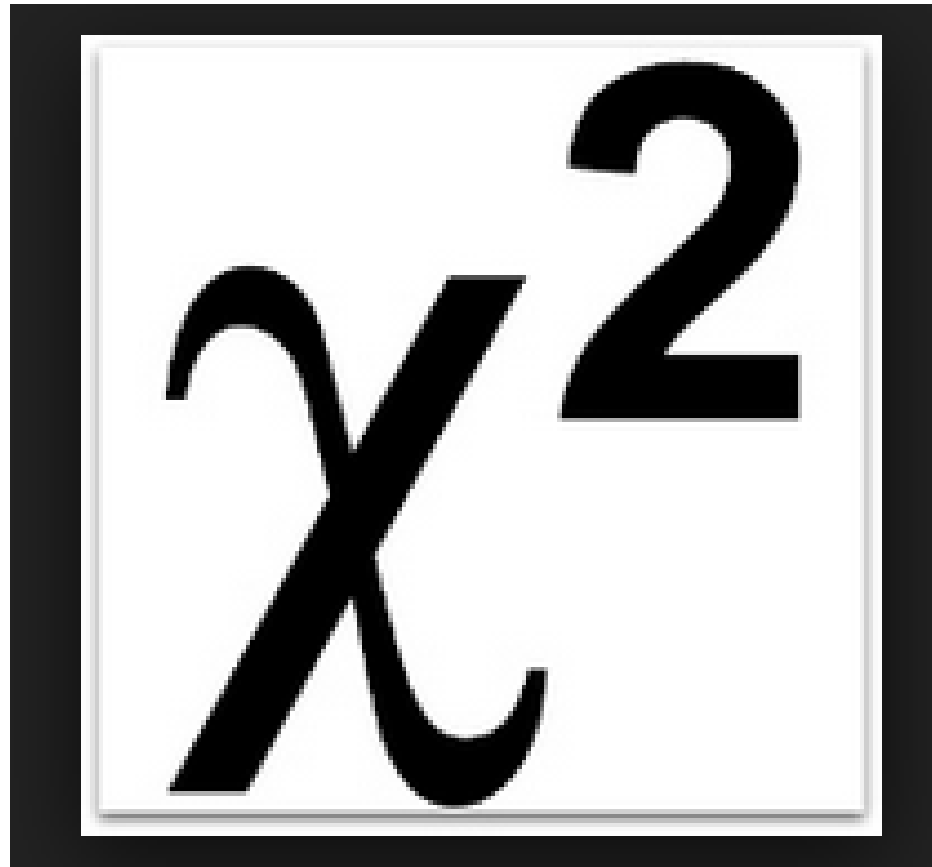

Rectangular Prism

The unit in your answer must be squared because we want to know how many flat squares it takes to cover the shape.

$m^2$

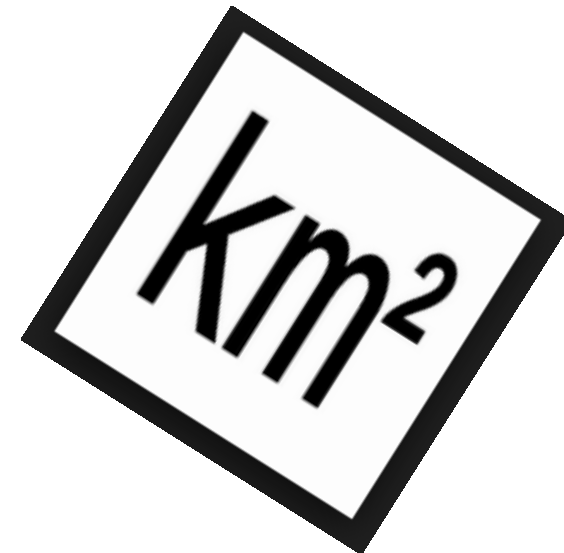

$x^2$

$cm^2$

$in^2$

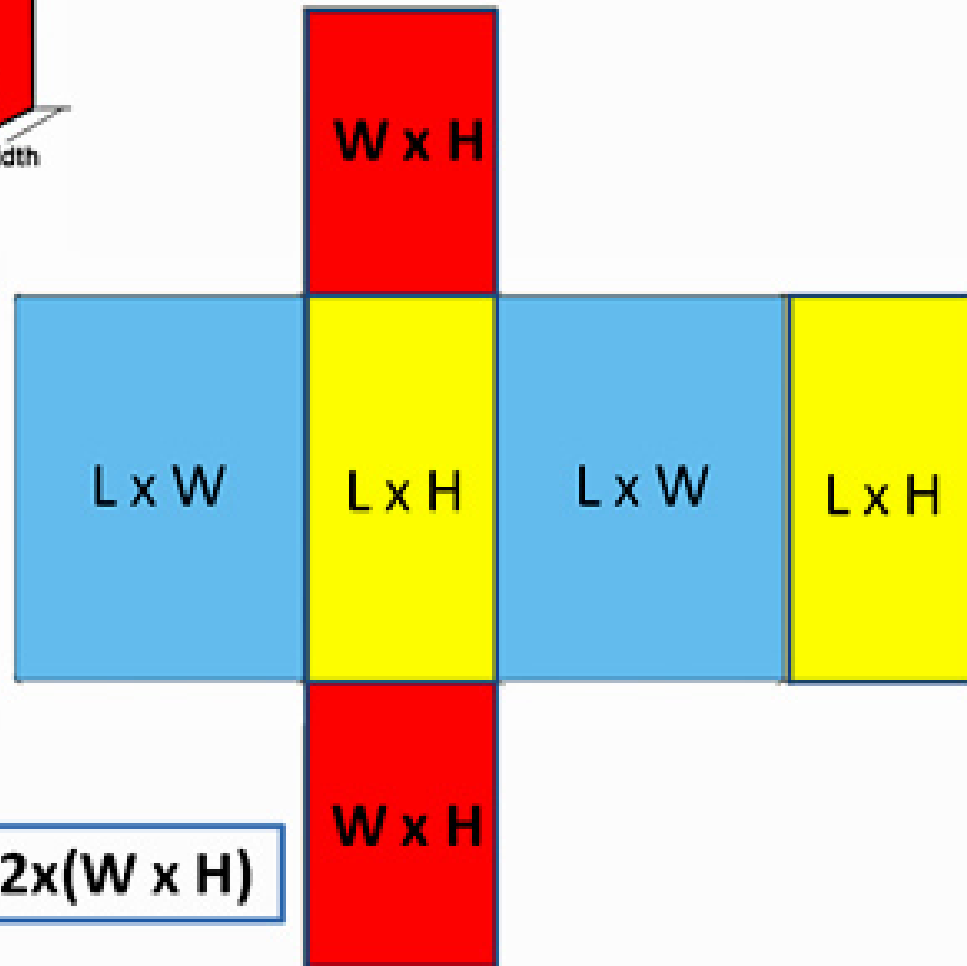

$km^2$

- Surface area of a rectangular prism is basically:
- The area of the six rectangles that cover it all added together.
- BUT we can do it even easier!

The "Total Surface Area" =

$2 \times (L \times W)$  : Two Blues  
 $+ 2 \times (L \times H)$  : Two Yellows  
 $+ 2 \times (W \times H)$  : Two Reds

$$\text{TSA} = 2 \times (L \times W) + 2 \times (L \times H) + 2 \times (W \times H)$$

- Find the area of each rectangle

$$w * h \quad l * w \quad l * h$$

- Add them +

- Then multiply by 2

## Rectangular Prism

Surface  
Area

$$A = 2 ( wh + lw + lh )$$

$$SA = 2 (wh + lw + lh)$$

Width=

Height=

Length=

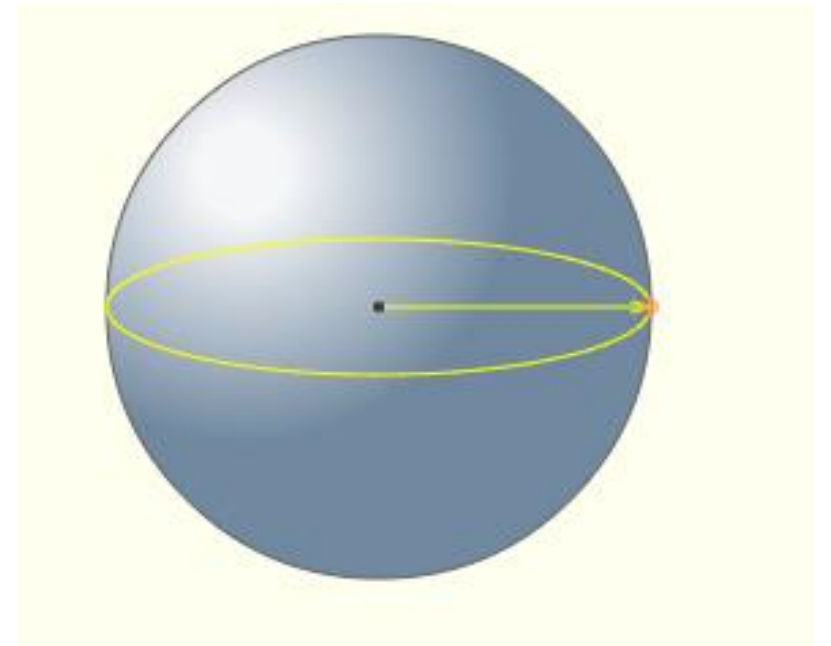

You practice with your teacher...

# Class Three

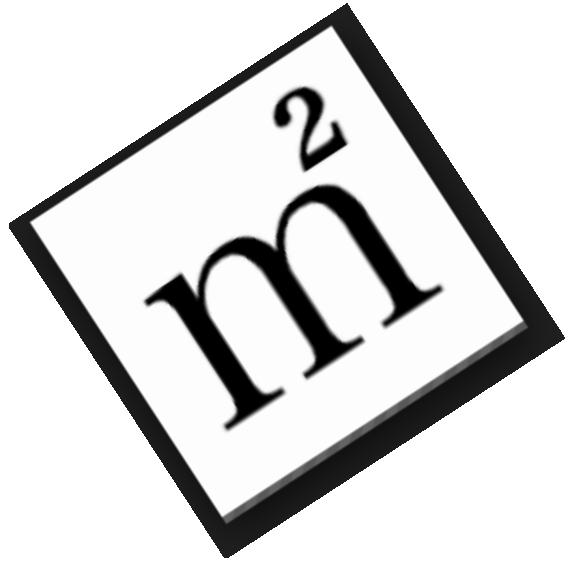

# Surface Area

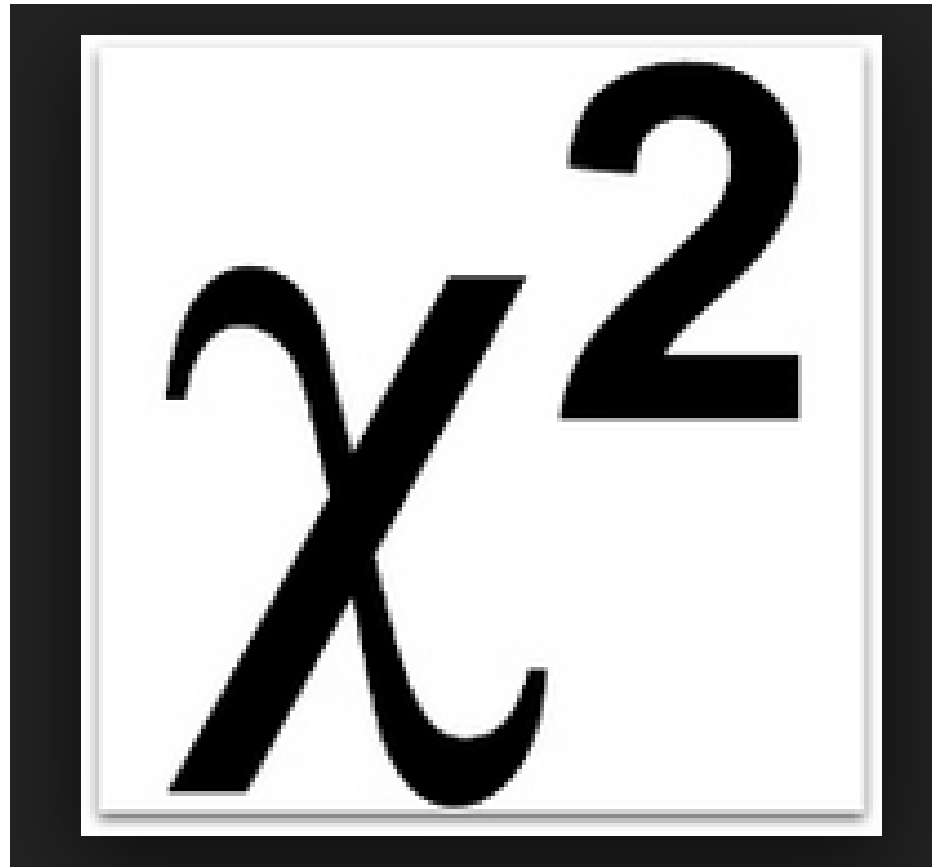

Sphere

The unit in your answer must be squared because we want to know how many flat squares it takes to cover the shape.

$m^2$

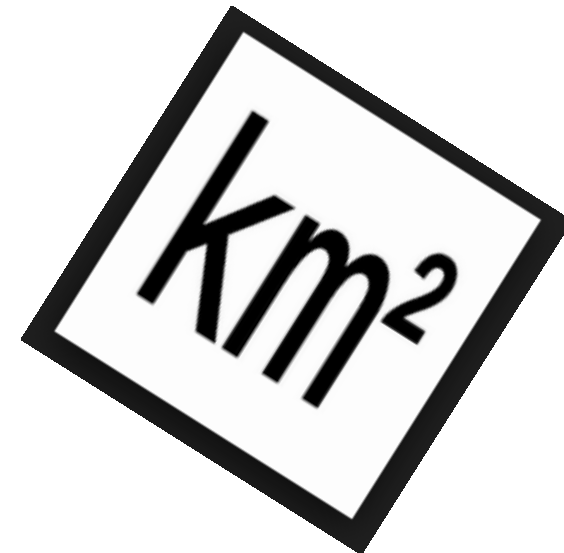

$x^2$

$cm^2$

$in^2$

$km^2$

Remember pi...

You will use the fractional form of pi...

It is not exact, but you will be working with fractions, so it will be easier for you!

**Sphere:**

$$\text{Surface area} = 4 \times \pi \times r^2$$

$\pi = 3.14$   
 $r$  is the radius

Pi is equal to 3.14  
BUT... use

$$SA = 4\pi r^2$$

Diameter =  $5 \frac{1}{2}$  cm

You practice with your teacher!

# Surface Area

Cylinder

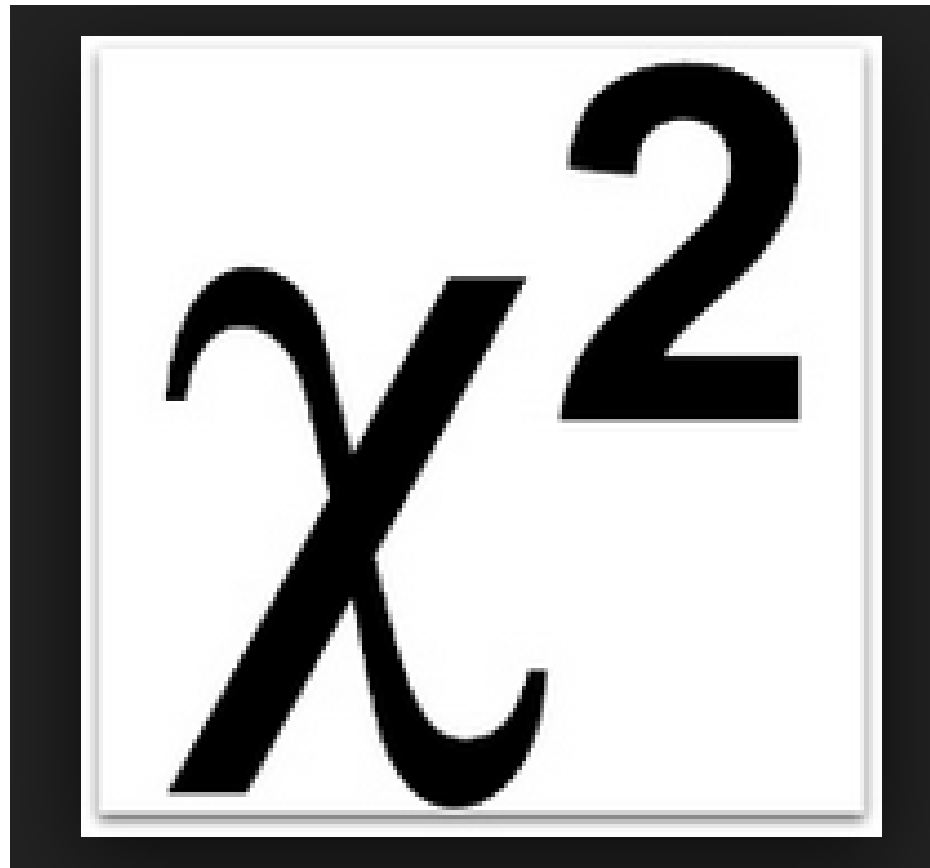

The unit in your answer must be squared because we want to know how many flat squares it takes to cover the shape.

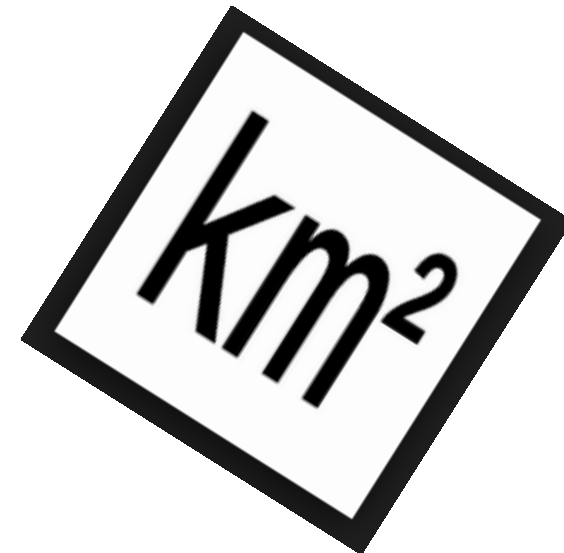

$m^2$

$cm^2$

$x^2$

$km^2$

$in^2$

$\pi$

=

$\frac{22}{7}$

$$\text{Surface area} = 2\pi r^2 + 2\pi r h$$

$$\text{Surface area} = 2\pi r^2 + 2\pi rh$$

Radius =  $1/3$  cm

Height = 4 cm

You practice with your teacher...
